# 33 YEARS OF BIG BIOLOGY

**HGP**  
was the end of one journey,  
  
**But**  
the beginning of another!

# Post-genomics

A broad name given to activities made possible  
by **genomic information**

# Omics Era

**DNA**

(storage)

Transcription  
Translation

**Gene Expression  
(Transcriptome)**

**Proteins**

**Proteomics**

Biochemical Circuitry

**Metabolomics**

**Phenotypes (Traits)**

**Environment  
Drug  
Disease**

- **Functional genomics:** understanding the **biological function** of genes and other parts of the genome, e.g.
  - Study of all genes expressed by a specific cell type
  - Study of changes in gene expression pattern
  - Assignment of biological function to genes
- Analysis of gene expression is the cornerstone of functional genomics

# Functional Genomics Tools

- **Bioinformatics**
- **DNA microarrays**
- Differential display
- Subtraction hybridization
- SAGE
- **Proteomic tools** e.g. 2-D gel electrophoresis, mass spectrophotometry, protein arrays etc.

# DNA Microarray Technology (Hybridization Array Technology)

High-throughput and large-scale technology to study all genes, their expression and/or their interaction simultaneously

# What are DNA arrays or Gene Chips ?

- DNA arrays consist of large numbers of DNA molecules spotted in a systemic order on a solid substrate.
- Depending on the size of each DNA spot on the array, DNA arrays can be categorized as *microarrays* (dia <250 um) and *macroarrays* (dia >300 um).
- When the solid substrate used is small in size, arrays are also referred to as **DNA chips** or **Gene Chips**

# TYPES OF GENE CHIPS

## **A. Based on manufacturing**

- Photolithography (synthesis on chip)
- Mechanical microspotting (delivery to chip)
- Ink jetting (delivery to chip)
- Pin and ring spotting (delivery to chip)

## B. Based on function of microarrays

## C. Based on types of probes

### Oligo-Chip

20 - 30 n

Sequencing & Expression

### cDNA-Chip

< 2,000 n

Expression

### Genomic Chip

> 50,000 n

Genomic analysis

# Basic format of DNA microarrays

1. Spotting DNA of interest on solid substrate at defined positions
2. Sample isolation and labeling
3. Probe/target hybridization
4. Imaging of hybridization results and image analysis

# Advantages of DNA microarrays

- **Faster** : Experiments can be performed at a faster rate
- **Parallelism**: Users can simultaneously screen hundreds to thousands of targets in a single experiment
- **Automation**: Analysis of gene chips can be automated through hardware/software
- **Economic**:
  - Less reagents and samples are needed for experiments
  - Low cost per target with microarray

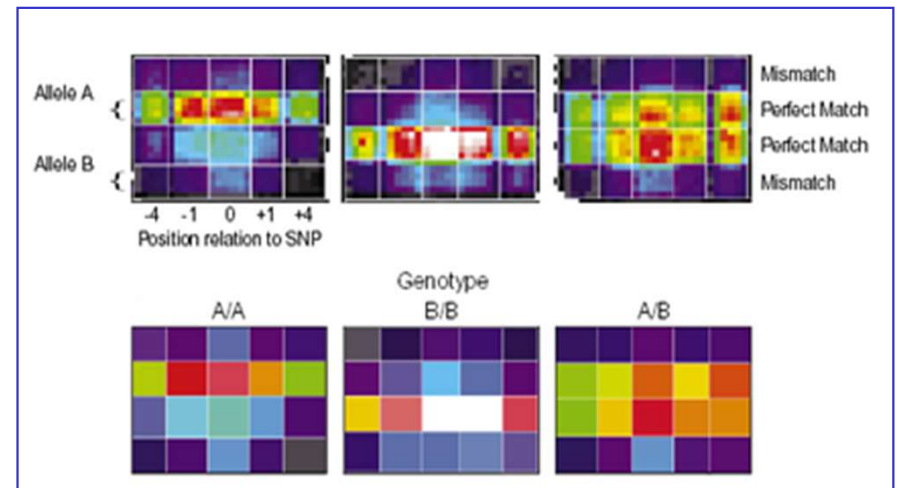

# Microarrays - Applications

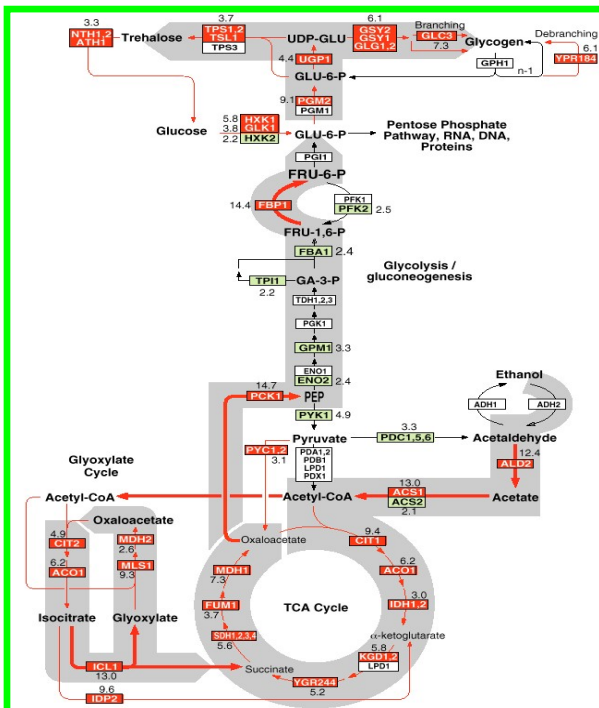

- **Gene expression**

- ❖ Focus of most current array-based studies is monitoring of RNA expression levels
- ❖ approx. 75 % of all publications

- **DNA variation**

- ❖ identification and genotyping of mutations and polymorphisms (SNPs)
- ❖ approx. 25 % of all publications

# Bioinformatics

**Data** → **Information** → **Knowledge**

The science (and art) of converting large sets of raw data to meaningful information = **Knowledge**

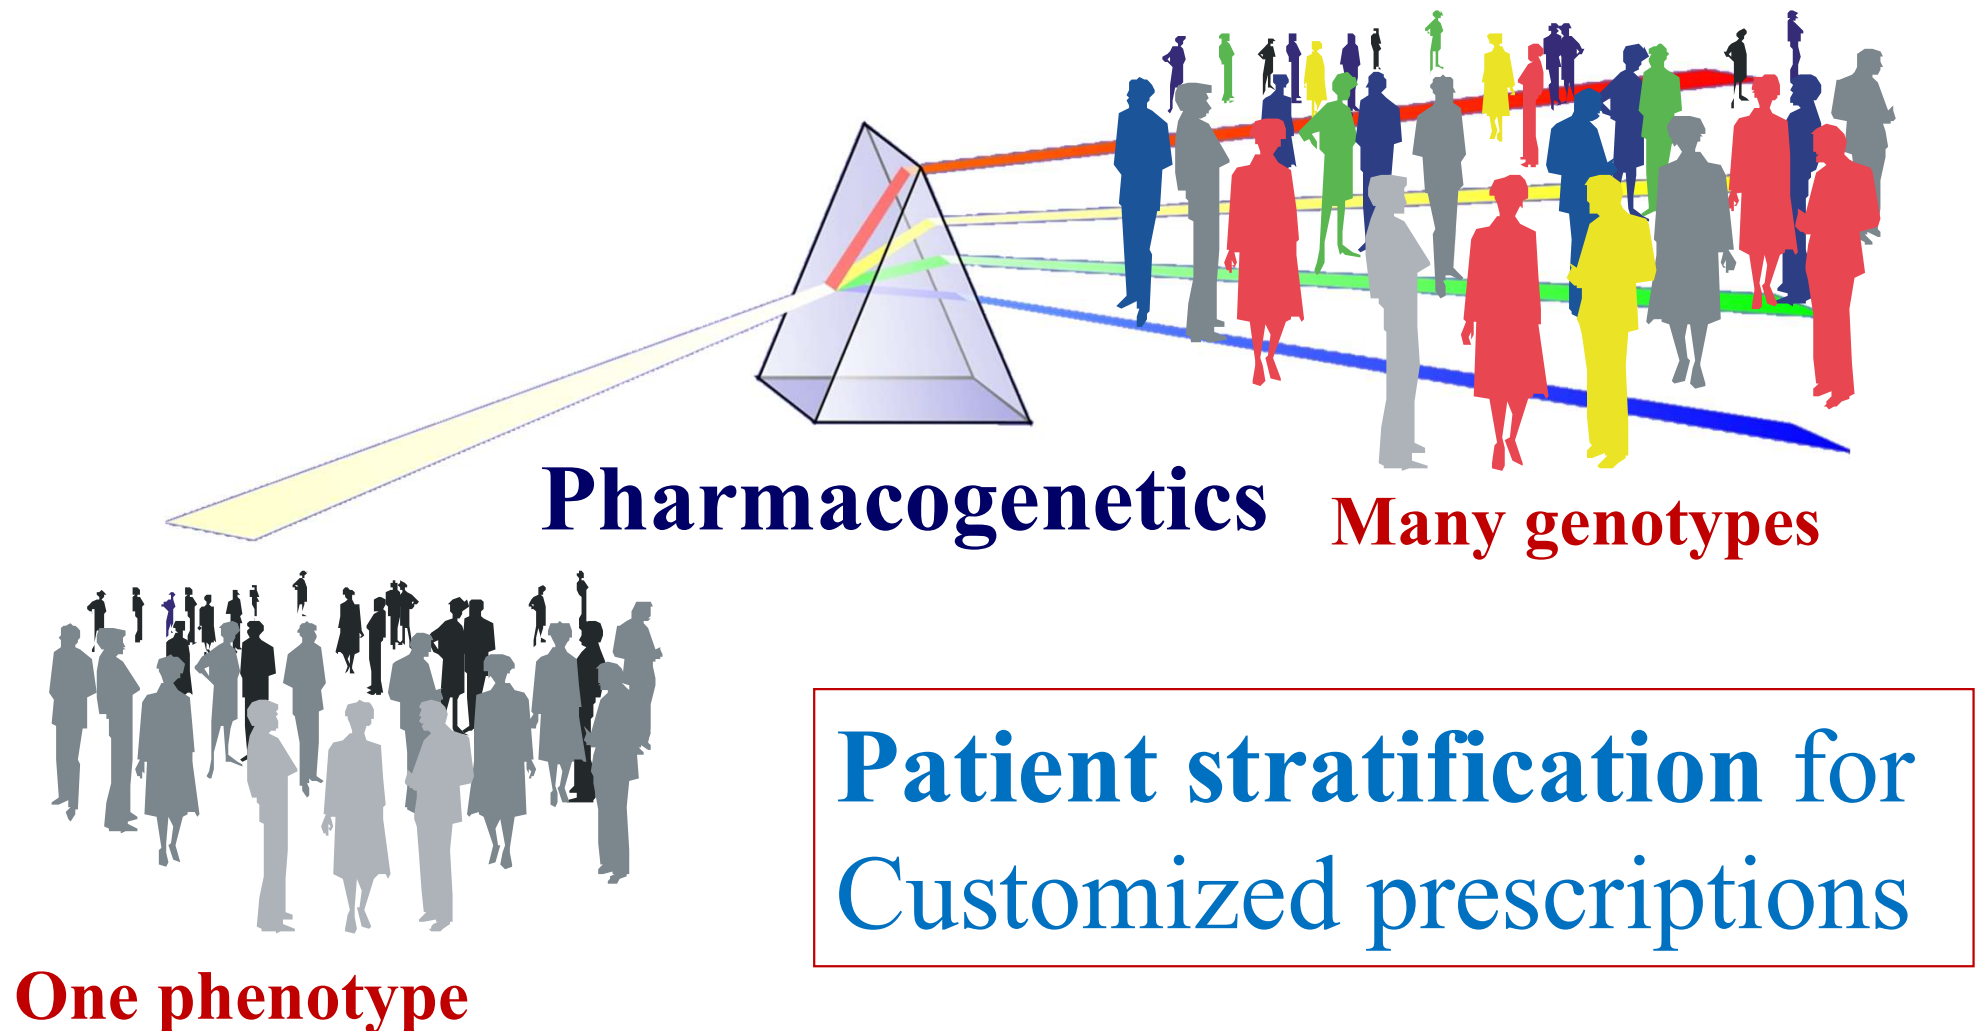

# Difference Expression Profiles in Diffuse Large B cell lymphoma

DNA microarrays approach to study expression profiles coupled with other type of information can be used in several biomedical research areas

# Applications of DNA Microarrays in Pharmacogenetics

# GeneChip CYP450 Probe Array

Fluorescent labeled DNA fragments ( \* )  
hybridized to the Oligonucleotide probes on the chip

Oligonucleotide probes attached to the chip surface

# Proteomics

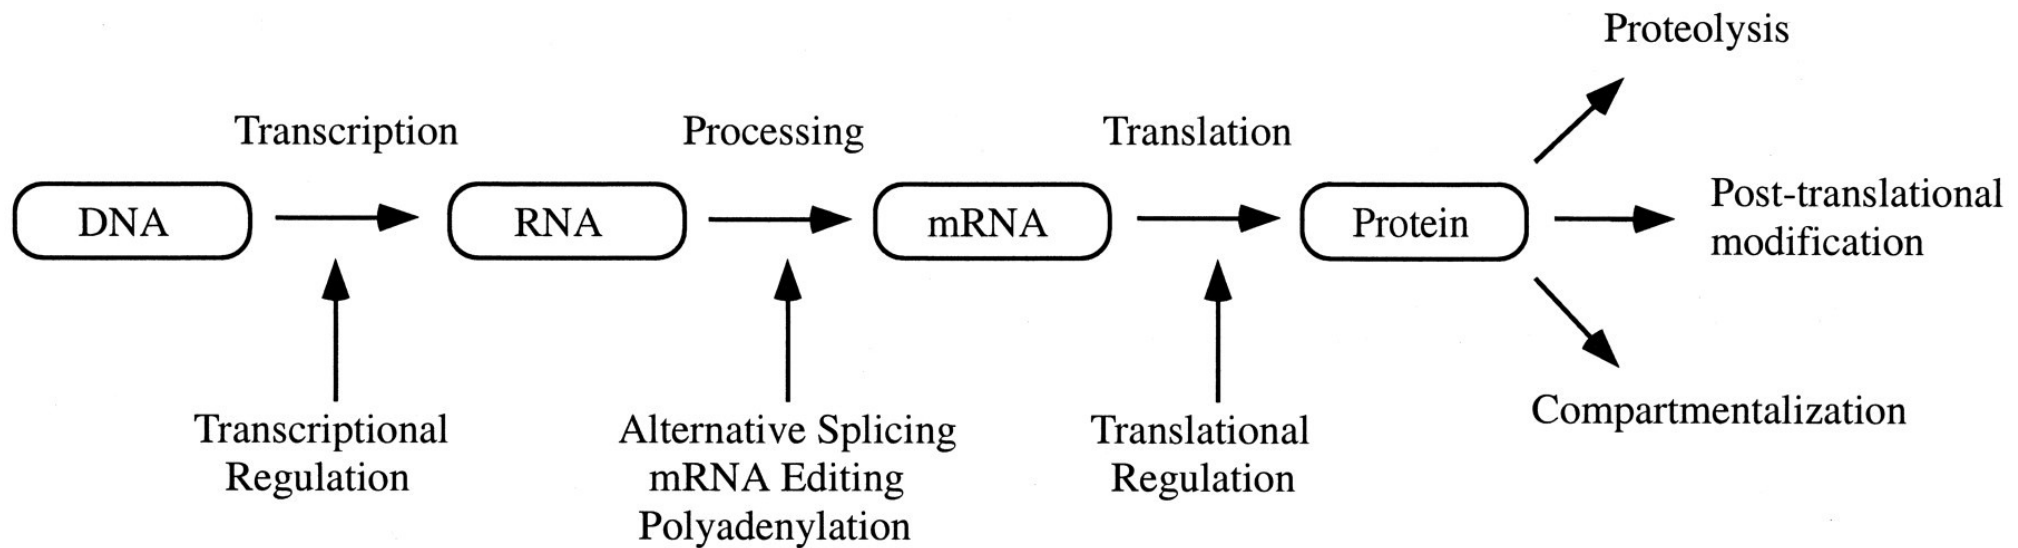

- The study of all the protein functions (*expression level and pattern, post translational modification etc.*) produced by cell type, tissue or organism on a large scale to obtain a global, integrated view of physiological and pathophysiological processes and networks at the protein level
- It involves the isolation, separation, identification and characterization of the proteins in the body

- **Proteome** refers to all the proteins expressed by a genome. (*proteome is dynamic*)
- **Differential or Expression proteomics:** The study of protein expression in comparative tissues samples.
- **Functional proteomics:** The study of how proteins interact with other cellular components in a single time frame.

# Why proteomics?

- Many types of information cannot be obtained from the study of genes alone, *e.g. genomic information does not predict post-translational modifications*
- Annotation of the genome: genome information have to integrate with data obtained from protein studies to confirm the existence of a particular gene.
- mRNA expression (genomic scale) profile is not a direct reflection of the protein content in the cell.

- Protein modification
- Protein localization & compartmentalization
- Protein – protein interactions

- A gene can give rise to multiple gene products.
- The average number of protein forms per gene was predicted to be : 1-2 in bacteria, 3 in yeast, more than three in humans.

# **Techonlogy of Proteomics**

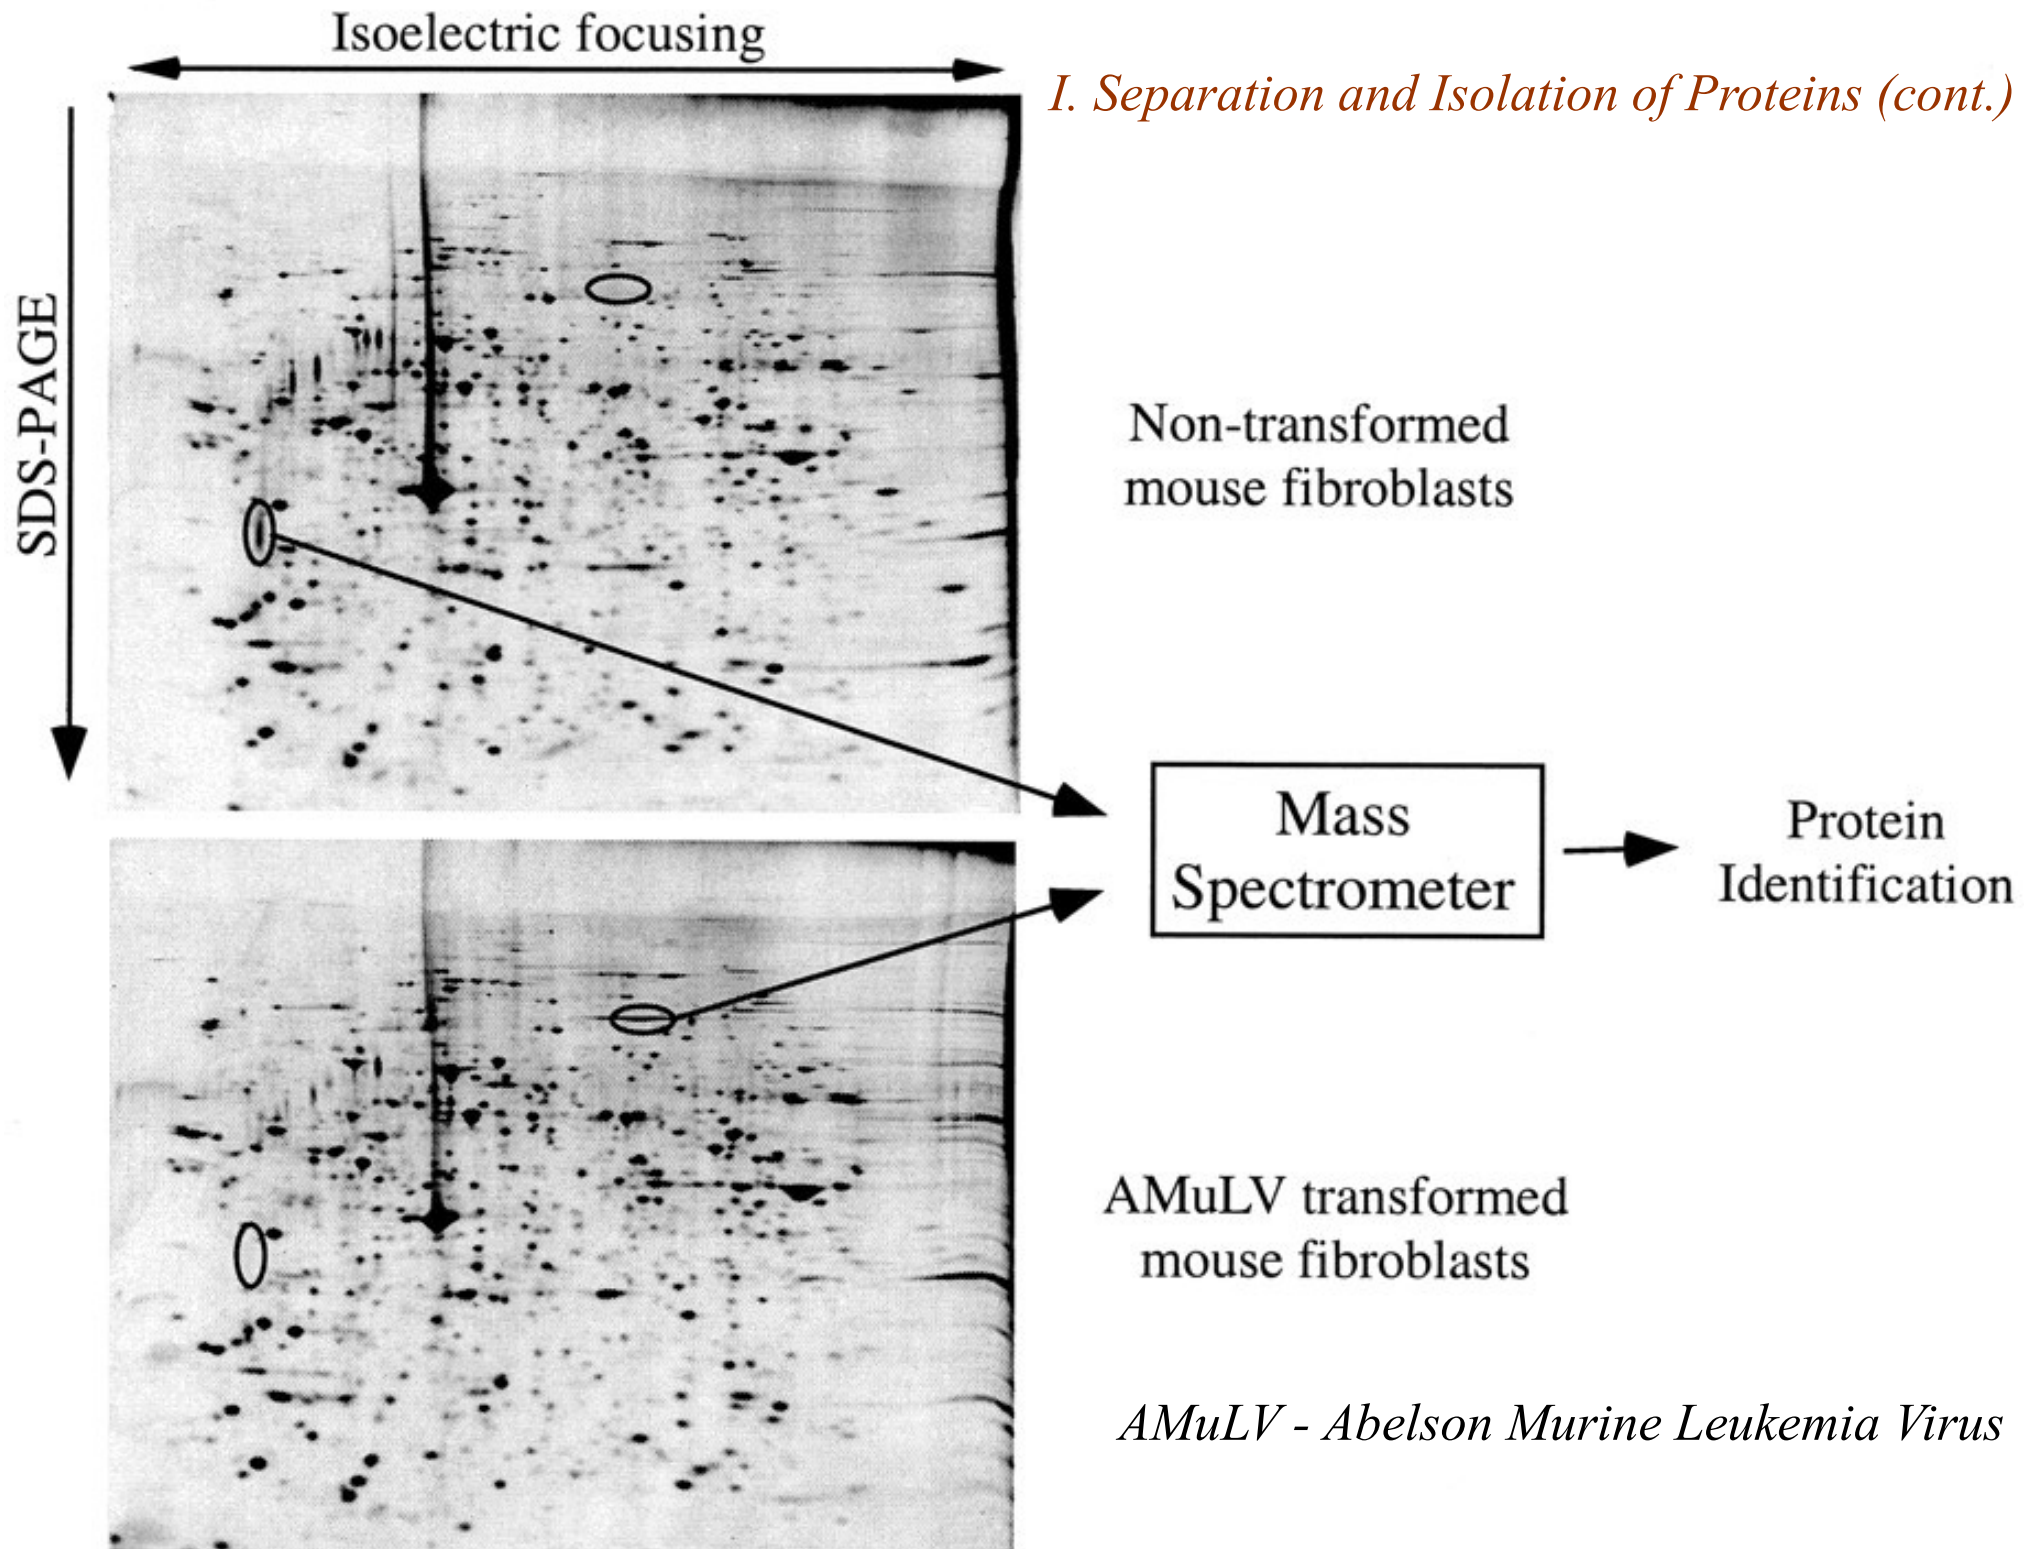

- I. Separation and Isolation of Proteins
- II. Acquisition of Protein Structure Information
- III. Database Utilization

# **I. Separation and Isolation of Proteins**

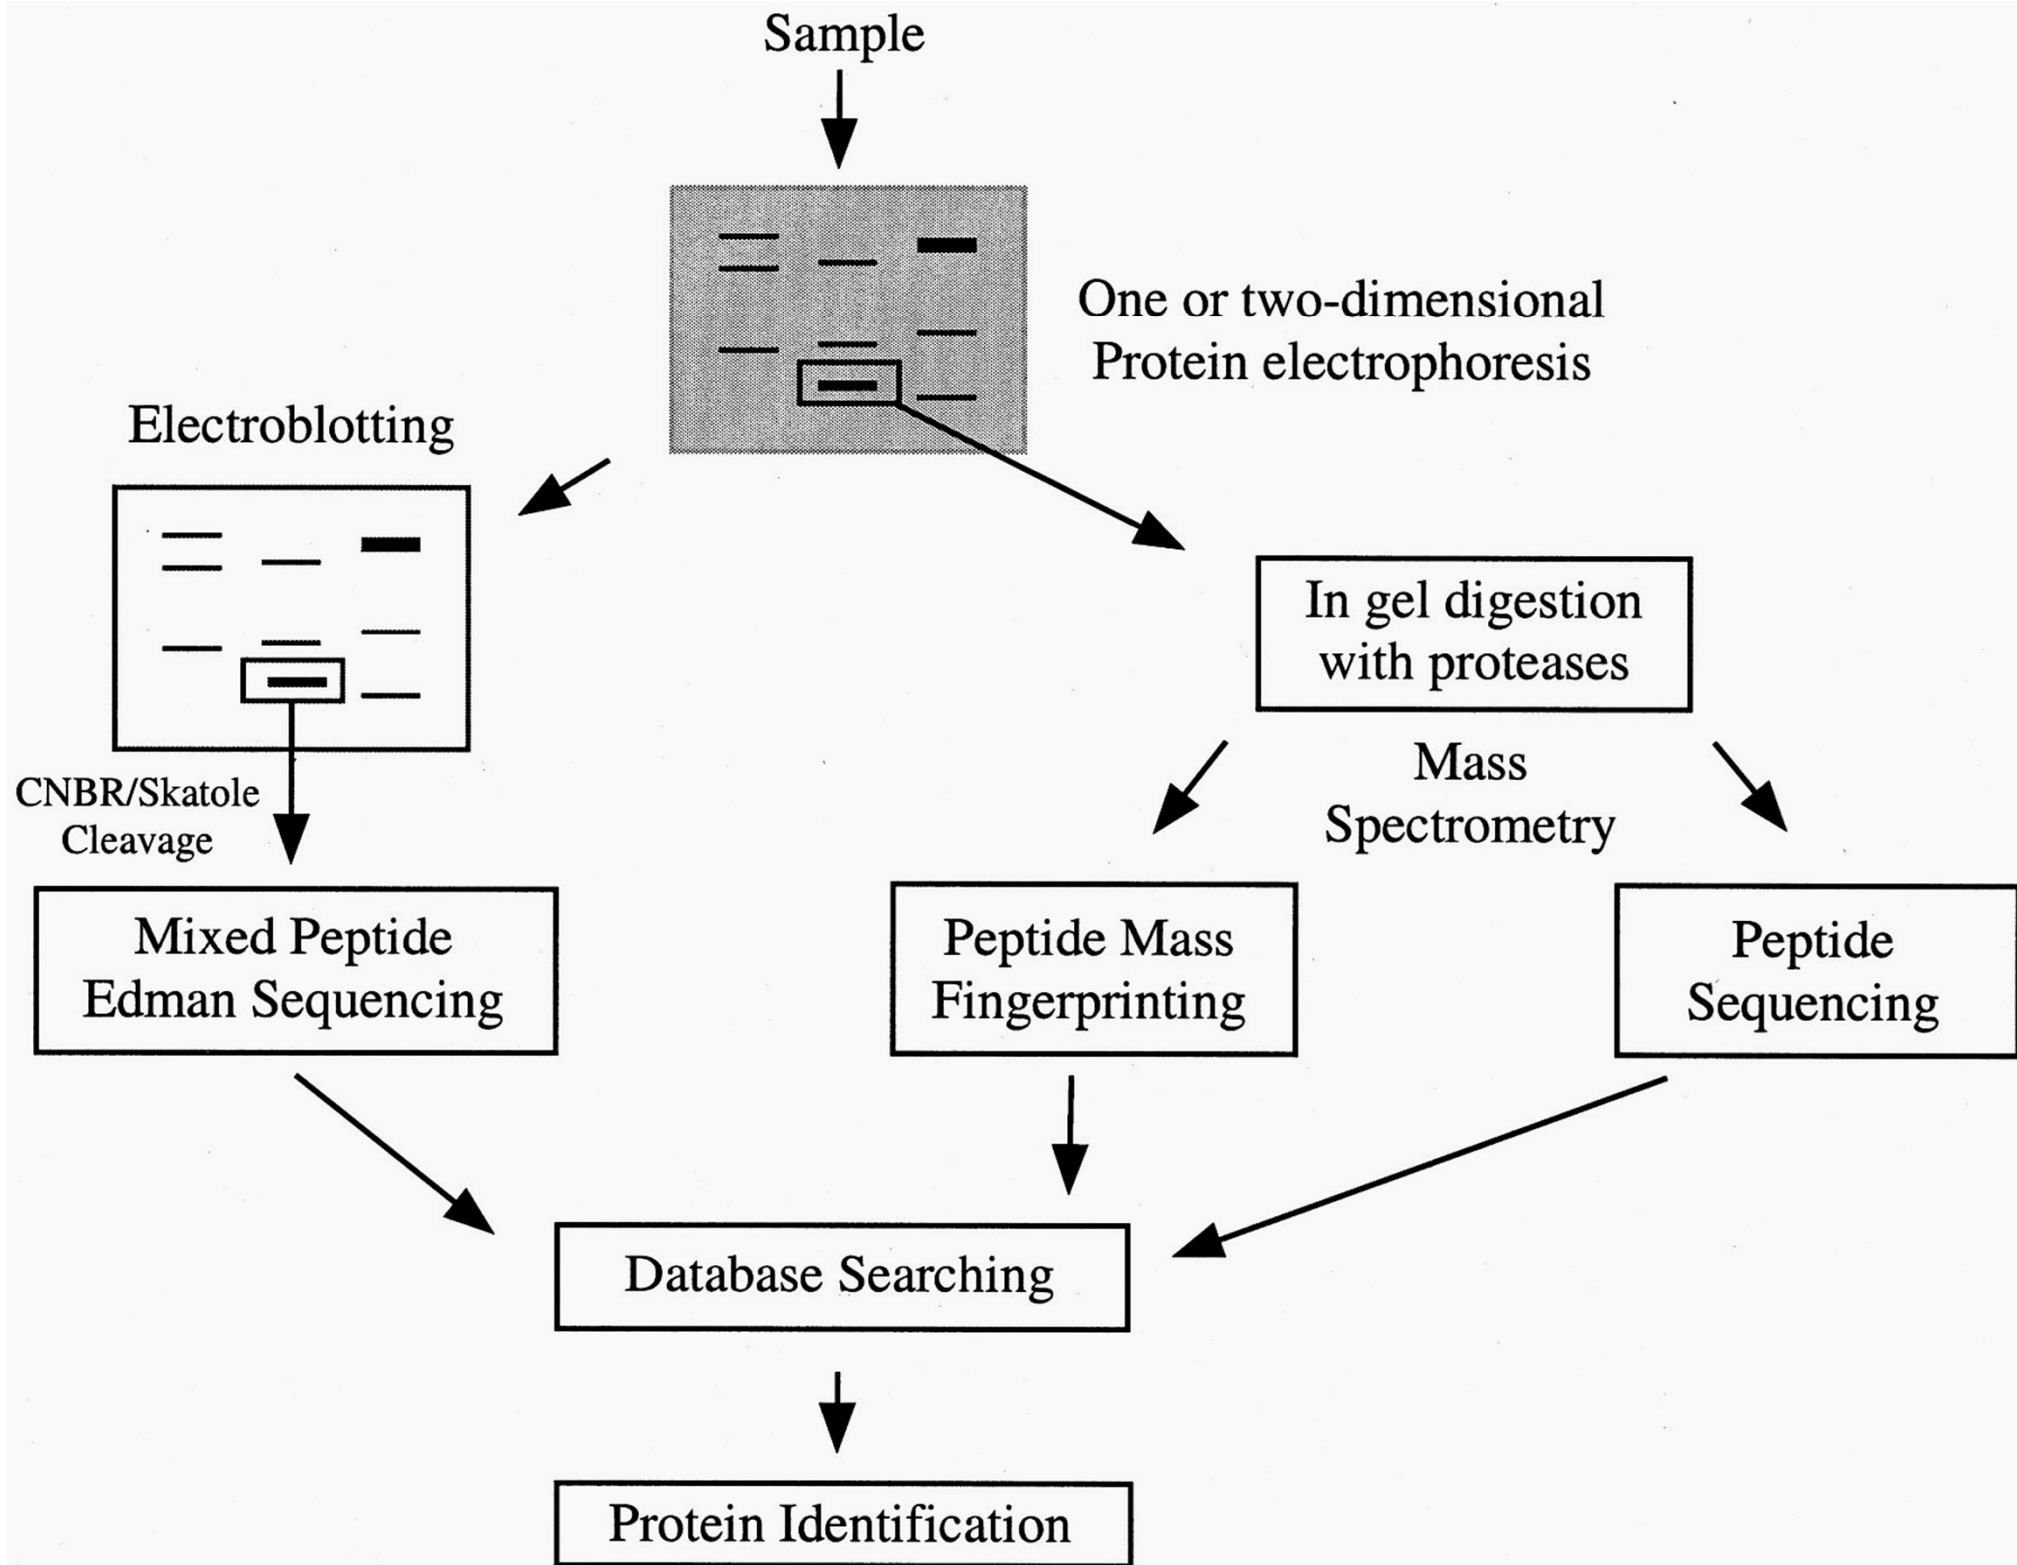

1. One – and two–dimensional gel electrophoresis
2. Alternatives to electrophoresis

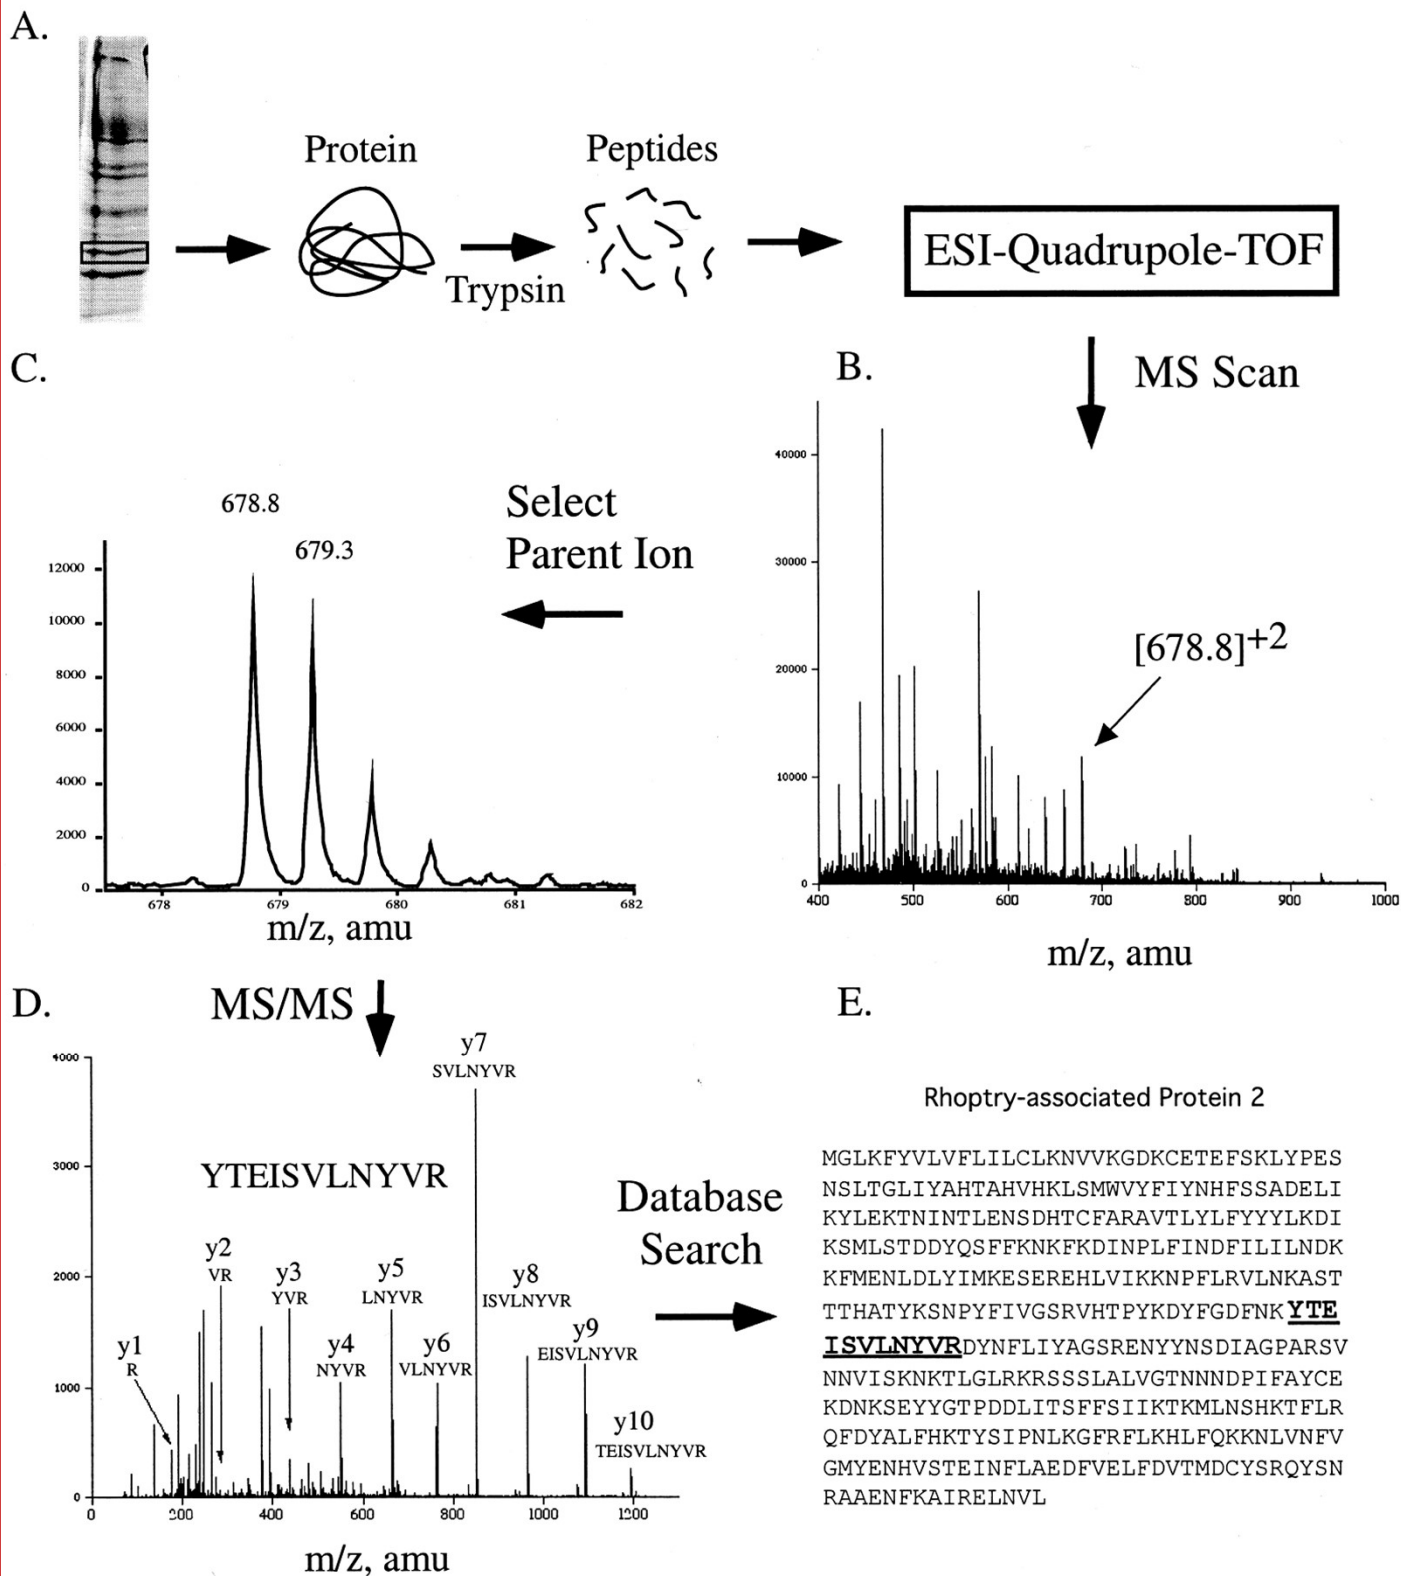

*I. Separation and Isolation of Proteins (cont.)*

## **II. Acquisition of Protein Structure Information**

- ❖ Edman sequencing
- ❖ Mass spectrometry

**Genomics**

# The Impact of the Human Genome Project in Medicine

- Once all genes are known, we will start understanding their function, their interactions and their pathways in various situations including pathological conditions.
- Thus, it is possible for us to correlate disease states to certain gene(s)
  - **Disease → Gene(s)**
  - **Gene(s) → Disease**
- Finally, it is possible to find ways for diagnosis, prognosis, rational treatments and monitoring
