

Chapter 17, Problem 1.

Evaluate each of the following functions and see if it is periodic. If periodic, find its period.

(a) $f(t) = \cos \pi t + 2 \cos 3 \pi t + 3 \cos 5 \pi t$

(b) $y(t) = \sin t + 4 \cos 2 \pi t$

(c) $g(t) = \sin 3t \cos 4t$

(d) $h(t) = \cos^2 t$

(e) $z(t) = 4.2 \sin(0.4 \pi t + 10^\circ) + 0.8 \sin(0.6 \pi t + 50^\circ)$

(f) $p(t) = 10$

(g) $q(t) = e^{-\pi t}$

Chapter 17, Solution 1.

(a) This is **periodic** with $\omega = \pi$ which leads to $T = 2\pi/\omega = \underline{2}$.

(b) $y(t)$ is **not periodic** although $\sin t$ and $4 \cos 2\pi t$ are independently periodic.

(c) Since $\sin A \cos B = 0.5[\sin(A + B) + \sin(A - B)]$,
 $g(t) = \sin 3t \cos 4t = 0.5[\sin 7t + \sin(-t)] = -0.5 \sin t + 0.5 \sin 7t$
which is harmonic or **periodic** with the fundamental frequency
 $\omega = 1$ or $T = 2\pi/\omega = \underline{2\pi}$.

(d) $h(t) = \cos^2 t = 0.5(1 + \cos 2t)$. Since the sum of a periodic function and a constant is also **periodic**, $h(t)$ is periodic. $\omega = 2$ or $T = 2\pi/\omega = \underline{\pi}$.

(e) The frequency ratio $0.6/0.4 = 1.5$ makes $z(t)$ **periodic**.
 $\omega = 0.2\pi$ or $T = 2\pi/\omega = \underline{10}$.

(f) $p(t) = 10$ is **not periodic**.

(g) $g(t)$ is **not periodic**.

Chapter 17, Problem 2.

ML Using MATLAB, synthesize the periodic waveform for which the Fourier trigonometric series is

$$f(t) = \frac{1}{2} - \frac{4}{\pi^2} \left(\cos t + \frac{1}{9} \cos 3t + \frac{1}{25} \cos 5t + \cdots \right)$$

Chapter 17, Solution 2.

The function $f(t)$ has a DC offset and is even. We use the following MATLAB code to plot $f(t)$. The plot is shown below. If more terms are taken, the curve is clearly indicating a triangular wave shape which is easily represented with just the DC component and three, cosinusoidal terms of the expansion.

```
for n=1:100
    tn(n)=n/10;
    t=n/10;
    y1=cos(t);
    y2=(1/9)*cos(3*t);
    y3=(1/25)*cos(5*t);
    factor=4/(pi*pi);
    y(n)=0.5- factor*(y1+y2+y3);
end
plot(tn,y)
```

Chapter 17, Problem 4.

Find the Fourier series expansion of the backward sawtooth waveform of Fig. 17.48. Obtain the amplitude and phase spectra.

Figure 17.48

For Probs. 17.4 and 17.66.

Chapter 17, Solution 4.

$$f(t) = 10 - 5t, \quad 0 < t < 2, \quad T = 2, \quad \omega_0 = 2\pi/T = \pi$$

$$a_0 = (1/T) \int_0^T f(t) dt = (1/2) \int_0^2 (10 - 5t) dt = 0.5 [10t - (5t^2/2)]_0^2 = 5$$

$$\begin{aligned} a_n &= (2/T) \int_0^T f(t) \cos(n\omega_0 t) dt = (2/2) \int_0^2 (10 - 5t) \cos(n\pi t) dt \\ &= \int_0^2 (10) \cos(n\pi t) dt - \int_0^2 (5t) \cos(n\pi t) dt \\ &= \left. \frac{-5}{n^2 \pi^2} \cos n\pi t \right|_0^2 + \left. \frac{5t}{n\pi} \sin n\pi t \right|_0^2 = [-5/(n^2 \pi^2)](\cos 2n\pi - 1) = 0 \end{aligned}$$

$$\begin{aligned} b_n &= (2/2) \int_0^2 (10 - 5t) \sin(n\pi t) dt \\ &= \int_0^2 (10) \sin(n\pi t) dt - \int_0^2 (5t) \sin(n\pi t) dt \\ &= \left. \frac{-5}{n^2 \pi^2} \sin n\pi t \right|_0^2 + \left. \frac{5t}{n\pi} \cos n\pi t \right|_0^2 = 0 + [10/(n\pi)](\cos 2n\pi) = 10/(n\pi) \end{aligned}$$

$$\text{Hence} \quad \underline{f(t) = 5 + \frac{10}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin(n\pi t)}$$

Chapter 17, Problem 5.

Obtain the Fourier series expansion for the waveform shown in Fig. 17.49.

Figure 17.49
For Prob. 17.5.

Chapter 17, Solution 5.

$$T = 2\pi, \quad \omega = 2\pi/T = 1$$

$$a_0 = \frac{1}{T} \int_0^T z(t) dt = \frac{1}{2\pi} [1 \times \pi - 2 \times \pi] = -0.5$$

$$a_n = \frac{2}{T} \int_0^T z(t) \cos n\omega_0 dt = \frac{1}{\pi} \int_0^\pi 1 \cos ntdt - \frac{1}{\pi} \int_\pi^{2\pi} 2 \cos ntdt = \frac{1}{n\pi} \sin nt \Big|_0^\pi - \frac{2}{n\pi} \sin nt \Big|_\pi^{2\pi} = 0$$

$$b_n = \frac{2}{T} \int_0^T z(t) \sin n\omega_0 dt = \frac{1}{\pi} \int_0^\pi 1 \sin ntdt - \frac{1}{\pi} \int_\pi^{2\pi} 2 \sin ntdt = -\frac{1}{n\pi} \cos nt \Big|_0^\pi + \frac{2}{n\pi} \cos nt \Big|_\pi^{2\pi} = \begin{cases} \frac{6}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases}$$

Thus,

$$z(t) = -0.5 + \underbrace{\sum_{\substack{n=1 \\ n=\text{odd}}}^{\infty} \frac{6}{n\pi} \sin nt}$$

Chapter 17, Problem 6.

Find the trigonometric Fourier series for

$$f(t) = \begin{cases} 5, & 0 < t < \pi \\ 10, & \pi < t < 2\pi \end{cases} \quad \text{and} \quad f(t + 2\pi) = f(t).$$

Chapter 17, Solution 6.

$$T = 2\pi, \quad \omega_0 = 2\pi/T = 1$$

$$a_0 = \frac{1}{T} \int_0^T f(t) dt = \frac{1}{2\pi} \left[\int_0^\pi 5 dt + \int_\pi^{2\pi} 10 dt \right] = \frac{1}{2\pi} (5\pi + 10\pi) = 7.5$$

$$a_n = \frac{2}{T} \int_0^T f(t) \cos n\omega_0 t dt = \frac{2}{2\pi} \left[\int_0^\pi 5 \cos nt dt + \int_\pi^{2\pi} 10 \cos nt dt \right] = 0$$

$$\begin{aligned} b_n &= \frac{2}{T} \int_0^T f(t) \sin n\omega_0 t dt = \frac{2}{2\pi} \left[\int_0^\pi 5 \sin nt dt + \int_\pi^{2\pi} 10 \sin nt dt \right] = \frac{1}{\pi} \left[-\frac{1}{n} \cos nt \Big|_0^\pi - \frac{1}{n} \cos nt \Big|_\pi^{2\pi} \right] \\ &= \frac{5}{n\pi} [\cos \pi n - 1] = \begin{cases} -\frac{10}{n\pi}, & n = \text{odd} \\ 0, & n = \text{even} \end{cases} \end{aligned}$$

Thus,

$$f(t) = 7.5 - \sum_{n=\text{odd}} \frac{10}{n\pi} \sin nt$$

Chapter 17, Problem 7.

ML * Determine the Fourier series of the periodic function in Fig. 17.50.

Figure 17.50

For Prob. 17.7.

* An asterisk indicates a challenging problem.

Chapter 17, Solution 7.

$$T = 3, \quad \omega_o = 2\pi / T = 2\pi / 3$$

$$a_o = \frac{1}{T} \int_0^T f(t) dt = \frac{1}{3} \left[\int_0^2 2 dt + \int_2^3 (-1) dt \right] = \frac{1}{3}(4 - 1) = 1$$

$$\begin{aligned} a_n &= \frac{2}{T} \int_0^T f(t) \cos \frac{2n\pi t}{3} dt = \frac{2}{3} \left[\int_0^2 2 \cos \frac{2n\pi t}{3} dt + \int_2^3 (-1) \cos \frac{2n\pi t}{3} dt \right] \\ &= \frac{2}{3} \left[2 \frac{3}{2n\pi} \sin \frac{2n\pi t}{3} \Big|_0^2 - 1 \frac{3}{2n\pi} \sin \frac{2n\pi t}{3} \Big|_2^3 \right] = \frac{3}{n\pi} \sin \frac{4n\pi}{3} \end{aligned}$$

$$\begin{aligned} b_n &= \frac{2}{T} \int_0^T f(t) \sin \frac{2n\pi t}{3} dt = \frac{2}{3} \left[\int_0^2 2 \sin \frac{2n\pi t}{3} dt + \int_2^3 (-1) \sin \frac{2n\pi t}{3} dt \right] \\ &= \frac{2}{3} \left[-2 \times \frac{3}{2n\pi} \cos \frac{2n\pi t}{3} \Big|_0^2 + \frac{3}{2n\pi} \cos \frac{2n\pi t}{3} \Big|_2^3 \right] = \frac{3}{n\pi} \left(1 - 2 \cos \frac{4n\pi}{3} \right) \\ &= \frac{1}{n\pi} \left(2 - 3 \cos \frac{4n\pi}{3} + 1 \right) = \frac{3}{n\pi} \left(1 - \cos \frac{4n\pi}{3} \right) \end{aligned}$$

Hence,

$$f(t) = 1 + \sum_{n=0}^{\infty} \left[\frac{3}{n\pi} \sin \frac{4n\pi}{3} \cos \frac{2n\pi t}{3} + \frac{3}{n\pi} \left(1 - \cos \frac{4n\pi}{3} \right) \sin \frac{2n\pi t}{3} \right]$$

We can now use MATLAB to check our answer,

```
>> t=0:.01:3;
>> f=1*ones(size(t));
>> for n=1:1:99,
f=f+(3/(n*pi))*sin(4*n*pi/3)*cos(2*n*pi*t/3)+(3/(n*pi))*(1-
cos(4*n*pi/3))*sin(2*n*pi*t/3);
end
>> plot(t,f)
```

Clearly we have the same figure we started with!!

Obtain the exponential Fourier series of the function in Fig. 17.51.

Figure 17.51

Chapter 17, Solution 8.

$$T = 2, \quad \omega_o = 2\pi / T = \pi$$

$$f(t) = \begin{cases} 5(1-t), & 0 < t < 1 \\ 0, & 1 < t < 2 \end{cases}$$

$$\begin{aligned} c_n &= \frac{1}{T} \int_0^T f(t) e^{-jn\omega_o t} dt = \frac{1}{2} \int_0^1 5(1-t) e^{-jn\pi t} dt \\ &= \frac{5}{2} \int_0^1 e^{-jn\pi t} dt - \frac{5}{2} \int_0^1 t e^{-jn\pi t} dt = \frac{5}{2} \frac{e^{-jn\pi t}}{-jn\pi} \bigg|_0^1 - \frac{5}{2} \frac{e^{-jn\pi t}}{(-jn\pi)^2} (-jn\pi t - 1) \bigg|_0^1 \\ &= \frac{5}{2} \frac{[e^{-jn\pi} - 1]}{-jn\pi} - \frac{5}{2} \frac{e^{-jn\pi}}{-n^2\pi^2} (-jn\pi - 1) + \frac{5}{2} \frac{(-1)}{-n^2\pi^2} \end{aligned}$$

But $e^{-jn\pi} = \cos n\pi - j\sin n\pi = \cos n\pi + 0 = (-1)^n$

$$c_n = \frac{2.5[1 - (-1)^n]}{jn\pi} - \frac{2.5(-1)^n[1 + jn\pi]}{n^2\pi^2} + \frac{2.5}{n^2\pi^2}$$

Chapter 17, Problem 9.

Determine the Fourier coefficients a_n and b_n of the first three harmonic terms of the rectified cosine wave in Fig. 17.52.

Figure 17.52

For Prob. 17.9.

Chapter 17, Solution 9.

$f(t)$ is an even function, $b_n=0$.

$$T = 8, \quad \omega = 2\pi/T = \pi/4$$

$$a_0 = \frac{1}{T} \int_0^T f(t) dt = \frac{2}{8} \left[\int_0^2 10 \cos \pi t / 4 dt + 0 \right] = \frac{10}{4} \left(\frac{4}{\pi} \right) \sin \pi t / 4 \Big|_0^2 = \frac{10}{\pi} = 3.183$$

$$a_n = \frac{4}{T} \int_0^{T/2} f(t) \cos n\omega_0 t dt = \frac{40}{8} \left[\int_0^2 10 \cos \pi t / 4 \cos n\pi t / 4 dt + 0 \right] = 5 \int_0^2 [\cos \pi t (n+1) / 4 + \cos \pi t (n-1) / 4] dt$$

For $n = 1$,

$$a_1 = 5 \int_0^2 [\cos \pi t / 2 + 1] dt = 5 \left[\frac{2}{\pi} \sin \pi t / 2 + t \right]_0^2 = 10$$

For $n > 1$,

$$a_n = \frac{20}{\pi(n+1)} \sin \frac{\pi(n+1)t}{4} + \frac{20}{\pi(n-1)} \sin \frac{\pi(n-1)t}{4} \Big|_0^2 = \frac{20}{\pi(n+1)} \sin \frac{\pi(n+1)}{2} + \frac{20}{\pi(n-1)} \sin \frac{\pi(n-1)}{2}$$

$$a_2 = \frac{20}{3\pi} \sin 1.5\pi + \frac{20}{\pi} \sin \pi / 2 = 4.244, \quad a_3 = \frac{20}{4\pi} \sin 2\pi + \frac{10}{\pi} \sin \pi = 0$$

Thus,

$$\underline{a_0 = 3.183, \quad a_1 = 10, \quad a_2 = 4.244, \quad a_3 = 0, \quad b_1 = 0 = b_2 = b_3}$$

If $v_2(t)$ is shifted by 1 along the vertical axis, we obtain $v_2^*(t)$ shown below, i.e. $v_2^*(t) = v_2(t) + 1$.

Comparing $v_2^*(t)$ with $v_1(t)$ shows that

$$v_2^*(t) = 2v_1((t+t_0)/2)$$

$$\text{where } (t+t_0)/2 = 0 \text{ at } t = -1 \text{ or } t_0 = 1$$

$$\text{But } v_2^*(t) = v_2(t) + 1$$

$$v_2(t) + 1 = 2v_1((t+1)/2)$$

$$v_2(t) = -1 + 2v_1((t+1)/2)$$

This is an even function.

$$b_n = 0, T = 6, \omega = 2\pi/6 = \pi/3$$

$$\begin{aligned} a_n &= \frac{4}{T} \int_0^{T/4} f(t) \cos(n\pi t / 3) dt \\ &= (4/6) \left[\int_1^2 (4t - 4) \cos(n\pi t / 3) dt + \int_2^3 4 \cos(n\pi t / 3) dt \right] \\ &= \frac{16}{6} \left[\frac{9}{n^2 \pi^2} \cos\left(\frac{n\pi t}{3}\right) + \frac{3t}{n\pi} \sin\left(\frac{n\pi t}{3}\right) - \frac{3}{n\pi} \sin\left(\frac{n\pi t}{3}\right) \right]_1^2 + \frac{16}{6} \left[\frac{3}{n\pi} \sin\left(\frac{n\pi t}{3}\right) \right]_2^3 \\ &= [24/(n^2 \pi^2)] [\cos(2n\pi/3) - \cos(n\pi/3)] \end{aligned}$$

Chapter 17, Solution 29.

This function is half-wave symmetric.

$$T = 2\pi, \quad \omega_0 = 2\pi/T = 1, \quad f(t) = -t, \quad 0 < t < \pi$$

$$\text{For odd } n, \quad a_n = \frac{2}{T} \int_0^\pi (-t) \cos(nt) dt = -\frac{2}{n^2\pi} [\cos(nt) + nt \sin(nt)]_0^\pi = 4/(n^2\pi)$$

$$b_n = \frac{2}{\pi} \int_0^\pi (-t) \sin(nt) dt = -\frac{2}{n^2\pi} [\sin(nt) - nt \cos(nt)]_0^\pi = -2/n$$

Thus,

$$f(t) = \underline{2 \sum_{k=1}^{\infty} \left[\frac{2}{n^2\pi} \cos(nt) - \frac{1}{n} \sin(nt) \right]}, \quad \underline{n = 2k - 1}$$

Chapter 17, Solution 30.

Chapter 17, Solution 32.

When $i_s = 1$ (DC component)

$$i = 1/(1 + 2) = 1/3$$

$$v_s(t) = \begin{cases} 1 & \text{for all } 0 < t < 1 \\ 2 & \text{for all } 1 < t < 1.5 \end{cases}$$

$$a_0 = \frac{2}{3} \left[\int_0^1 1 dt + \int_1^{1.5} 2 dt \right] = \frac{4}{3}$$

$$a_n = \frac{4}{3} \left[\int_0^1 \cos(2n\pi t / 3) dt + \int_1^{1.5} 2 \cos(2n\pi t / 3) dt \right]$$

$$v_s(t) = \frac{4}{3} - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin(2n\pi / 3) \cos(2n\pi t / 3)$$

Now consider this circuit,

Let $Z = [-j3/(2n\pi)](1)/(1 - j3/(2n\pi)) = -j3/(2n\pi - j3)$

Therefore, $v_o = Zv_s/(Z + 1 + j2n\pi/3)$. Simplifying, we get

$$v_o = \frac{-j9v_s}{12n\pi + j(4n^2\pi^2 - 18)}$$

For the dc case, $n = 0$ and $v_s = 3/4$ V and $v_o = v_s/2 = 3/8$ V.

We can now solve for $v_o(t)$

$$v_o(t) = \left[\frac{3}{8} + \sum_{n=1}^{\infty} A_n \cos\left(\frac{2n\pi t}{3} + \Theta_n\right) \right] \text{volts}$$

Figure 17.75
For Prob. 17.39.

Chapter 17, Solution 39.

Comparing $v_s(t)$ with $f(t)$ in Figure 15.1, v_s is shifted by 2.5 and the magnitude is 5 times that of $f(t)$.

Hence

$$v_s(t) = 5 + \frac{10}{\pi} \sum_{k=1}^{\infty} \frac{1}{n} \sin(n\pi t), \quad n = 2k - 1$$

$$T = 2, \quad \omega_o = 2\pi/T = \pi, \quad \omega_n = n\omega_o = n\pi$$

For the DC component, $i_o = 5/(20 + 40) = 1/12$

For the k th harmonic, $V_s = (10/(n\pi)) \angle 0^\circ$

$$100 \text{ mH becomes } j\omega_n L = jn\pi \times 0.1 = j0.1n\pi$$

$$50 \text{ mF becomes } 1/(j\omega_n C) = -j20/(n\pi)$$

$$\text{Let } Z = -j20/(n\pi) \parallel (40 + j0.1n\pi) = \frac{-\frac{j20}{n\pi}(40 + j0.1n\pi)}{-\frac{j20}{n\pi} + 40 + j0.1n\pi}$$

$$= \frac{-j20(40 + j0.1n\pi)}{-j20 + 40n\pi + j0.1n^2\pi^2} = \frac{2n\pi - j800}{40n\pi + j(0.1n^2\pi^2 - 20)}$$

$$Z_{in} = 20 + Z = \frac{802n\pi + j(2n^2\pi^2 - 1200)}{40n\pi + j(0.1n^2\pi^2 - 20)}$$

$$I = \frac{V_s}{Z_{in}} = \frac{400n\pi + j(n^2\pi^2 - 200)}{n\pi[802n\pi + j(2n^2\pi^2 - 1200)]}$$

$$I_o = \frac{-\frac{j20}{n\pi} I}{-\frac{j20}{n\pi} + (40 + j0.1n\pi)} = \frac{-j20I}{40n\pi + j(0.1n^2\pi^2 - 20)}$$

$$= \frac{-j200}{n\pi[802n\pi + j(2n^2\pi^2 - 1200)]}$$

$$= \frac{200\angle -90^\circ - \tan^{-1}\{(2n^2\pi^2 - 1200)/(802n\pi)\}}{n\pi\sqrt{(802)^2 + (2n^2\pi^2 - 1200)^2}}$$

Thus

$$i_o(t) = \frac{1}{20} + \frac{200}{\pi} \sum_{k=1}^{\infty} I_n \sin(n\pi t - \theta_n), \quad \underline{n = 2k - 1}$$

where $\theta_n = 90^\circ + \tan^{-1} \frac{2n^2\pi^2 - 1200}{802n\pi}$

 b_n &= \frac{2}{T} \int_0^T v(t) \sin(n\pi t) dt = 2 \int_0^1 (1-t) \sin(n\pi t) dt \\

 \end{aligned}$$

For the DC component, $v_s = 1/2$. As shown in Figure (a), the capacitor acts like an open circuit.

Applying KVL to the circuit in Figure (a) gives

$$-0.5 - 2V_x + 4i = 0 \quad (1)$$

$$\text{But} \quad -0.5 + i + V_x = 0 \text{ or } -1 + 2V_x + 2i = 0 \quad (2)$$

Adding (1) and (2), $-1.5 + 6i = 0$ or $i = 0.25$

$$V_o = 3i = 0.75$$

For the n th harmonic, we consider the circuit in Figure (b).

$$\omega_n = n\pi, \quad V_s = A_n \angle -\phi, \quad 1/(j\omega_n C) = -j4/(n\pi)$$

At the supernode,

$$(V_s - V_x)/1 = -[n\pi/(j4)]V_x + V_o/3$$

$$V_s = [1 + jn\pi/4]V_x + V_o/3 \quad (3)$$

$$\text{But} \quad -V_x - 2V_x + V_o = 0 \text{ or } V_o = 3V_x$$

Substituting this into (3),

$$\begin{aligned} V_s &= [1 + jn\pi/4]V_x + V_x = [2 + jn\pi/4]V_x \\ &= (1/3)[2 + jn\pi/4]V_o = (1/12)[8 + jn\pi]V_o \end{aligned}$$

$$V_o = 12V_s/(8 + jn\pi) = \frac{12A_n \angle -\phi}{\sqrt{64 + n^2 \pi^2} \angle \tan^{-1}(n\pi/8)}$$

$$V_o = \frac{12}{\sqrt{64 + n^2 \pi^2}} \sqrt{\frac{4}{n^2 \pi^2} + \frac{16}{\pi^4 (2n-1)^4}} \angle [\tan^{-1}(n\pi/8) - \tan^{-1}(\pi(2n-1)/(2n))]$$

Thus

$$v_o(t) = \frac{3}{4} + \sum_{n=1}^{\infty} V_n \cos(n\pi t + \theta_n)$$

where

$$V_n = \frac{12}{\sqrt{64 + n^2 \pi^2}} \sqrt{\frac{4}{n^2 \pi^2} + \frac{16}{\pi^4 (2n-1)^4}}$$

$$\theta_n = \tan^{-1}(n\pi/8) - \tan^{-1}(\pi(2n-1)/(2n))$$

The inductor acts like a short-circuit, while the capacitor acts like an open circuit.

For the n th harmonic,

The periodic current waveform in Fig. 17.79 is applied across a 2-k Ω resistor. Find the percentage of the total average power dissipation caused by the dc component.

Figure 17.79
For Prob. 17.47.

Chapter 17, Solution 47.

$$T = 2, \quad \omega_o = 2\pi / T = \pi$$

$$a_o = \frac{1}{T} \int_0^T f(t) dt = \frac{1}{2} \left[\int_0^1 4 dt + \int_1^2 (-2) dt \right] = \frac{1}{2}(4 - 2) = 1$$

$$P = Ri_{rms}^2 = \frac{R}{T} \int_0^T f^2(t) dt = \frac{R}{2} \left[\int_0^1 4^2 dt + \int_1^2 (-2)^2 dt \right] = 10R$$

The average power dissipation caused by the dc component is

$$P_o = Ra_o^2 = R = \underline{10\%} \text{ of } P$$

$$i(t) = 20 + 16 \cos(10t + 45^\circ) + 12 \cos(20t - 60^\circ) \text{ mA}$$

Chapter 17, Solution 48.

- (a) For the DC component, $i(t) = 20 \text{ mA}$. The capacitor acts like an open circuit so that

$$v = Ri(t) = 2 \times 10^3 \times 20 \times 10^{-3} = 40$$

For the AC component,

$$\omega_n = 10n, \quad n = 1, 2$$

$$1/(j\omega_n C) = -j/(10n \times 100 \times 10^{-6}) = (-j/n) \text{ k}\Omega$$

$$Z = 2 \parallel (-j/n) = 2(-j/n)/(2 - j/n) = -j2/(2n - j)$$

$$V = ZI = [-j2/(2n - j)]I$$

For $n = 1$, $V_1 = [-j2/(2 - j)]16 \angle 45^\circ = 14.311 \angle -18.43^\circ \text{ mV}$

For $n = 2$, $V_2 = [-j2/(4 - j)]12 \angle -60^\circ = 5.821 \angle -135.96^\circ \text{ mV}$

$$v(t) = \underline{40 + 0.014311 \cos(10t - 18.43^\circ) + 0.005821 \cos(20t - 135.96^\circ) \text{ V}}$$

(b)
$$p = V_{\text{DC}} I_{\text{DC}} + \frac{1}{2} \sum_{n=1}^{\infty} V_n I_n \cos(\theta_n - \phi_n)$$

$$= 20 \times 40 + 0.5 \times 10 \times 0.014311 \cos(45^\circ + 18.43^\circ) + 0.5 \times 12 \times 0.005821 \cos(-60^\circ + 135.96^\circ)$$

- (a) For the periodic waveform in Prob. 17.5, find the rms value.
 (b) Use the first five harmonic terms of the Fourier series in Prob. 17.5 to determine the effective value of the signal.
 (c) Calculate the percentage error in the estimated rms value of $z(t)$ if

$$\% \text{ error} = \left(\frac{\text{estimated value}}{\text{exact value}} - 1 \right) \times 100$$

Chapter 17, Solution 49.

$$(a) \quad Z_{\text{rms}}^2 = \frac{1}{T} \int_0^T z^2(t) dt = \frac{1}{2\pi} \left[\int_0^{\pi} 1 dt + \int_{\pi}^{2\pi} 4 dt \right] = \frac{1}{2\pi} (5\pi) = 2.5$$

$$\underline{Z_{\text{rms}} = 1.581}$$

(b)

$$Z_{\text{rms}}^2 = a_0^2 + \frac{1}{2} \sum_{n=1}^{\infty} (a_n^2 + b_n^2) = \frac{1}{4} + \frac{1}{2} \sum_{\substack{n=1 \\ n=\text{odd}}}^{\infty} \frac{36}{n^2 \pi^2} = \frac{1}{4} + \frac{18}{\pi^2} \left(1 + 0 + \frac{1}{9} + 0 + \frac{1}{25} + \dots \right) = 2.349$$

$$Z_{\text{rms}} = \underline{\underline{1.5326}}$$

$$(c) \quad \% \text{ error} = \left(1 - \frac{1.5326}{1.581} \right) \times 100 = \underline{\underline{3.061\%}}$$

Obtain the exponential Fourier series for $f(t) = t$, $-1 < t < 1$, with $f(t + 2n) = f(t)$ for all integer values of n .

Using integration by parts,

$$u = t \text{ and } du = dt$$

$$dv = e^{-jn\pi t} dt \text{ which leads to } v = -[1/(2jn\pi)] e^{-jn\pi t}$$

$$\begin{aligned} c_n &= -\frac{t}{2jn\pi} e^{-jn\pi t} \Big|_{-1}^1 + \frac{1}{2jn\pi} \int_{-1}^1 e^{-jn\pi t} dt \\ &= \frac{j}{n\pi} [e^{-jn\pi} + e^{jn\pi}] + \frac{1}{2n^2\pi^2(-j)^2} e^{-jn\pi t} \Big|_{-1}^1 \\ &= [j/(n\pi)] \cos(n\pi) + [1/(2n^2\pi^2)] (e^{-jn\pi} - e^{jn\pi}) \\ c_n &= \frac{j(-1)^n}{n\pi} + \frac{2j}{2n^2\pi^2} \sin(n\pi) = \frac{j(-1)^n}{n\pi} \end{aligned}$$

The Fourier series trigonometric representation of a periodic function is

Chapter 17, Solution 56.

$$c_0 = a_0 = 10, \quad \omega_0 = \pi$$

$$c_n = (a_n - jb_n)/2 = (1 - jn)/[2(n^2 + 1)]$$

Find the exponential Fourier series of a function that has the following trigonometric Fourier series coefficients:

$$a_0 = \frac{\pi}{4}, \quad b_n = \frac{(-1)^n}{n}, \quad a_n = \frac{(-1)^n - 1}{\pi n^2}$$

Thus

Chapter 17, Solution 59.

For $f(t)$, $T = 2\pi$, $\omega_0 = 2\pi/T = 1$.

$$a_0 = \text{DC component} = (1 \times \pi + 0)/2\pi = 0.5$$

$$a_0 = (2 \times 1 - 2 \times 1)/2 = 0$$

Thus by replacing $\omega_0 = 1$ with $\omega_0 = \pi$ and multiplying the magnitude by four, we obtain

A certain band-limited periodic current has only three frequencies in its Fourier series representation: dc, 50 Hz, and 100 Hz. The current may be represented as

$$i(t) = 4 + 6 \sin 100\pi t + 8 \cos 100\pi t \\ - 3 \sin 200\pi t - 4 \cos 200\pi t \text{ A}$$

(a) Express $i(t)$ in amplitude-phase form.

(b) If $i(t)$ flows through a $2\text{-}\Omega$ resistor, how many watts of average power will be dissipated?

Chapter 17, Solution 74.

$$(a) \quad A_n = \sqrt{a_n^2 + b_n^2}, \quad \phi = \tan^{-1}(b_n/a_n)$$

$$A_1 = \sqrt{6^2 + 8^2} = 10, \quad \phi_1 = \tan^{-1}(6/8) = 36.87^\circ$$

$$A_2 = \sqrt{3^2 + 4^2} = 5, \quad \phi_2 = \tan^{-1}(3/4) = 36.87^\circ$$

$$i(t) = \underline{\{4 + 10\cos(100\pi t - 36.87^\circ) - 5\cos(200\pi t - 36.87^\circ)\} \text{ A}}$$

$$(b) \quad p = I_{\text{DC}}^2 R + 0.5 \sum I_n^2 R \\ = 2[4^2 + 0.5(10^2 + 5^2)] = \underline{157 \text{ W}}$$

Chapter 17, Problem 75.

 Design a lowpass RC filter with a resistance $R = 2\text{ k}\Omega$. The input to the filter is a periodic rectangular pulse train (see Table 17.3) with $A = 1\text{ V}$, $T = 10\text{ ms}$, and $\tau = 1\text{ ms}$. Select C such that the dc component of the output is 50 times greater than the fundamental component of the output.

Chapter 17, Solution 75.

The lowpass filter is shown below.

$$v_s = \frac{A\tau}{T} + \frac{2A}{T} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi\tau}{T} \cos n\omega_o t$$

$$V_o = \frac{\frac{1}{j\omega_n C}}{R + \frac{1}{j\omega_n C}} V_s = \frac{1}{1 + j\omega_n RC} V_s, \quad \omega_n = n\omega_o = 2n\pi/T$$

For $n=0$, (dc component), $V_o = V_s = \frac{A\tau}{T}$ (1)

For the n th harmonic,

$$V_o = \frac{1}{\sqrt{1 + \omega_n^2 R^2 C^2}} \angle \tan^{-1} \omega_n RC \cdot \frac{2A}{nT} \sin \frac{n\pi\tau}{T} \angle -90^\circ$$

When $n=1$, $|V_o| = \frac{2A}{T} \sin \frac{n\pi\tau}{T} \cdot \frac{1}{\sqrt{1 + \frac{4\pi^2}{T} R^2 C^2}}$ (2)

From (1) and (2),

$$\frac{A\tau}{T} = 50 \times \frac{2A}{T} \sin \frac{\pi}{10} \frac{1}{\sqrt{1 + \frac{4\pi^2}{T} R^2 C^2}} \longrightarrow \sqrt{1 + \frac{4\pi^2}{T} R^2 C^2} = \frac{30.9}{\tau} = 3.09 \times 10^4$$

$$1 + \frac{4\pi^2}{T} R^2 C^2 = 10^{10} \longrightarrow C = \frac{T}{2\pi R} 10^5 = \frac{10^{-2} \times 3.09 \times 10^4}{4\pi \times 10^3} = \underline{24.59 \text{ mF}}$$

Chapter 17, Problem 76.

A periodic signal given by $v_s(t) = 10 \text{ V}$ for $0 < t < 1$ and 0 V for $1 < t < 2$ is applied to the highpass filter in Fig. 17.87. Determine the value of R such that the output signal $v_o(t)$ has an average power of at least 70 percent of the average power of the input signal.

Figure 17.87
For Prob. 17.76.

Chapter 17, Solution 76.

$v_s(t)$ is the same as $f(t)$ in Figure 16.1 except that the magnitude is multiplied by 10. Hence

$$v_o(t) = 5 + \frac{20}{\pi} \sum_{k=1}^{\infty} \frac{1}{n} \sin(n\pi t), \quad n = 2k - 1$$

$$T = 2, \quad \omega_o = 2\pi/T = \pi, \quad \omega_n = n\omega_o = n\pi$$

$$j\omega_n L = j2n\pi; \quad Z = R \parallel 10 = 10R/(10 + R)$$

$$V_o = ZV_s/(Z + j2n\pi) = [10R/(10R + j2n\pi(10 + R))]V_s$$

$$V_o = \frac{10R \angle -\tan^{-1}\{(n\pi/5R)(10 + R)\}}{\sqrt{100R^2 + 4n^2\pi^2(10 + R)^2}} V_s$$

$$V_s = [20/(n\pi)] \angle 0^\circ$$

The source current I_s is

$$I_s = \frac{V_s}{Z + j2n\pi} = \frac{V_s}{\frac{10R}{10+R} + j2n\pi} = \frac{(10+R)\frac{20}{n\pi}}{10R + j2n\pi(10+R)}$$

$$= \frac{(10+R)\frac{20}{n\pi} \angle -\tan^{-1}\{(n\pi/3)(10+R)\}}{\sqrt{100R^2 + 4n^2\pi^2(10+R)^2}}$$

$$p_s = V_{DC}I_{DC} + \frac{1}{2} \sum V_{sn} I_{sn} \cos(\theta_n - \phi_n)$$

For the DC case, L acts like a short-circuit.

$$I_s = \frac{5}{\frac{10R}{10+R}} = \frac{5(10+R)}{10R}, \quad V_s = 5 = V_o$$

$$p_s = \frac{25(10+R)}{10R} + \frac{1}{2} \left[\left(\frac{20}{\pi} \right)^2 \frac{(10+R) \cos\left(\tan^{-1}\left(\frac{\pi}{5}(10+R)\right)\right)}{\sqrt{100R^2 + 4\pi^2(10+R)^2}} \right. \\ \left. + \left(\frac{10}{\pi} \right)^2 \frac{(10+R)^2 \cos\left(\tan^{-1}\left(\frac{2\pi}{5}(10+R)\right)\right)}{\sqrt{100R^2 + 16\pi^2(10+R)^2}} + \dots \right]$$

$$p_s = \frac{V_{DC}}{R} + \frac{1}{2} \sum_{n=1}^{\infty} \frac{V_{on}}{R}$$

$$= \frac{25}{R} + \frac{1}{2} \left[\frac{100R}{100R^2 + 4\pi^2(10+R)^2} + \frac{100R}{100R^2 + 10\pi^2(10+R)^2} + \dots \right]$$

We want $p_o = (70/100) p_s = 0.7p_s$. Due to the complexity of the terms, we consider only the DC component as an approximation. In fact the DC component has the largest share of the power for both input and output signals.

$$\frac{25}{R} = \frac{7}{10} \times \frac{25(10+R)}{10R}$$

$$100 = 70 + 7R \text{ which leads to } R = 30/7 = \underline{\underline{4.286 \Omega}}$$

Chapter 17, Problem 77.

The voltage across a device is given by

$$v(t) = -2 + 10 \cos 4t + 8 \cos 6t + 6 \cos 8t \\ - 5 \sin 4t - 3 \sin 6t - \sin 8t \text{ V}$$

Find:

- (a) the period of $v(t)$,
- (b) the average value of $v(t)$,
- (c) the effective value of $v(t)$.

Chapter 17, Solution 77.

- (a) For the first two AC terms, the frequency ratio is $6/4 = 1.5$ so that the highest common factor is 2. Hence $\omega_o = 2$.

$$T = 2\pi/\omega_o = 2\pi/2 = \underline{\pi}$$

- (b) The average value is the DC component = **-2**

$$(c) \quad V_{\text{rms}} = \sqrt{a_o^2 + \frac{1}{2} \sum_{n=1}^{\infty} (a_n^2 + b_n^2)}$$

$$V_{\text{rms}}^2 = (-2)^2 + \frac{1}{2} (10^2 + 8^2 + 6^2 + 3^2 + 1^2) = 121.5$$

$$V_{\text{rms}} = \underline{\underline{\mathbf{11.02 \text{ V}}}}$$

Chapter 17, Problem 78.

A certain band-limited periodic voltage has only three harmonics in its Fourier series representation. The harmonics have the following rms values: fundamental 40 V, third harmonic 20 V, fifth harmonic 10 V.

(a) If the voltage is applied across a 5- Ω resistor, find the average power dissipated by the resistor.

(b) If a dc component is added to the periodic voltage and the measured power dissipated increases by 5 percent, determine the value of the dc component added.

Chapter 17, Solution 78.

$$\begin{aligned} \text{(a)} \quad p &= \frac{V_{\text{DC}}^2}{R} + \frac{1}{2} \sum \frac{V_n^2}{R} = \frac{V_{\text{DC}}^2}{R} + \sum \frac{V_{n,\text{rms}}^2}{R} \\ &= 0 + (40^2/5) + (20^2/5) + (10^2/5) = \underline{\underline{420 \text{ W}}} \end{aligned}$$

$$\text{(b)} \quad 5\% \text{ increase} = (5/100)420 = 21$$

$$p_{\text{DC}} = 21 \text{ W} = \frac{V_{\text{DC}}^2}{R} \quad \text{which leads to} \quad V_{\text{DC}}^2 = 21R = 105$$

$$V_{\text{DC}} = \underline{\underline{10.25 \text{ V}}}$$

Chapter 17, Problem 81.

Consider the full-wave rectified sinusoidal current in Table 17.3. Assume that the current is passed through a 1- Ω resistor.

- Find the average power absorbed by the resistor.
- Obtain c_n for $n = 1, 2, 3$, and 4.
- What fraction of the total power is carried by the dc component?
- What fraction of the total power is carried by the second harmonic ($n = 2$)?

Chapter 17, Solution 81.

(a)

$$f(t) = \frac{2A}{\pi} - \frac{4A}{\pi} \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1} \cos(n\omega_0 t)$$

The total average power is $p_{\text{avg}} = F_{\text{rms}}^2 R = F_{\text{rms}}^2$ since $R = 1 \text{ ohm}$.

$$P_{\text{avg}} = F_{\text{rms}}^2 = \frac{1}{T} \int_0^T f^2(t) dt = \underline{\underline{0.5A^2}}$$

(b) From the Fourier series above

$$|c_0| = 2A/\pi, \quad |c_n| = |a_n|/2 = 2A/[\pi(4n^2 - 1)]$$

n	ω_0	$ c_n $	$ c_0 ^2$ or $2 c_n ^2$	% power

Chapter 17, Problem 82.

A band-limited voltage signal is found to have the complex Fourier coefficients presented in the table below. Calculate the average power that the signal would supply a 4- Ω resistor.

$n\omega_0$	$ c_n $	θ_n
0	10.0	0°
ω	8.5	15°
2ω	4.2	30°
3ω	2.1	45°
4ω	0.5	60°
5ω	0.2	75°

Chapter 17, Solution 82.

$$P = \frac{V_{DC}^2}{R} + \frac{1}{2} \sum_{n=1}^{\infty} \frac{V_n^2}{R}$$

Assuming V is an amplitude-phase form of Fourier series. But

$$|A_n| = 2|C_n|, \quad c_0 = a_0$$

$$|A_n|^2 = 4|C_n|^2$$

Hence,

$$P = \frac{c_0^2}{R} + 2 \sum_{n=1}^{\infty} \frac{c_n^2}{R}$$

Alternatively,

$$P = \frac{V_{rms}^2}{R}$$

where

$$V_{rms}^2 = a_0^2 + \frac{1}{2} \sum_{n=1}^{\infty} A_n^2 = c_0^2 + 2 \sum_{n=1}^{\infty} c_n^2 = \sum_{n=-\infty}^{\infty} c_n^2$$

$$= 10^2 + 2(8.5^2 + 4.2^2 + 2.1^2 + 0.5^2 + 0.2^2)$$

$$= 100 + 2 \times 94.57 = 289.14$$

$$P = 289.14/4 = \underline{\underline{72.3 \text{ W}}}$$
